<u>Cover Letter</u>

Dear Employer,

I am an aerospace engineer looking to apply my problem-solving skills and mathematical ability to a fast-paced industry. I want to face new challenges every day and innovatively overcome them. After graduation I want to get an internship or graduate scheme to start learning software in a professional environment and gain as much valuable experience as possible.

In my studies as an engineer and previous work experience, I have developed the ability to think critically, solve complex problems and work hard which are crucial skills in software. While on my year in industry I worked on design reviews and optimisation, all whilst working to high-level industry standards (AS9100) and dealing with sensitive information.

I developed a passion for coding in my first year of university in a computing module where I was first introduced to Python. I found it was the only module I could happily spend hours on end working on and I realised I wasn't working because I had to but because I liked the work I was doing. After spending my summer improving my coding, I realised it's the career I want.

I am a quick and keen learner. I have great people skills. I am reliable, responsible, and resourceful. I'm a very well-rounded individual and always seek to excel in everything I do. I can easily work in a team; I played lots of team sports in my youth. I can also lead, often I captained these teams.

I am ready to start my career in software, learn more and journey into the tech industry. I believe my skills and qualities make me an ideal candidate and I hope you consider my application.

Sincerely,
Robert
